---

1. Getting started

System requirements

• Windows 10/11 (x64)

• Self-contained build: no separate .NET install needed

• Receipt printer (ESC/POS, port 9100), cash drawer, customer display — all optional

• LAN recommended for multi-terminal (main PC + order PCs)

Launch

Run **Vectron POS.exe**.

The **shared database folder** (`client database`) must be reachable. On the first PC choose *Main PC* mode; on other terminals choose *Order PC* and point it at the Main PC path (e.g. `\\MAIN-PC\client database`).

The **login screen** appears.

First-run setup

Log in as **Manager** (default PIN `1234`).

Open **Settings** and configure:

- **Manage operators** — create staff, set roles and PINs

- **Manage products / families** — build the menu

- **Room management** — rooms and tables

- **Printer routing** — which printer receives which ticket

- **Currency and TVA** — currency symbol and tax rates

Toggle features on/off under each Settings category to match how you trade.

---

2. Login and operators

• The login screen lists every operator. Select a name (or use the dropdown), enter the **PIN**, press **Enter**.

• Roles: **Manager** (full access) and **Operator** (floor duties). Permissions (products, refunds, voids, settings, reports…) are granted per role.

• **Clock-in on login** (when enabled): the app records a shift start automatically. Clock out from **Operator** in the sidebar or at end of day.

• **Training mode**: sales are not recorded and a banner reminds you. Toggle it from Settings → Staff.

---

3. Order screen

The main screen has three zones: **menu (center)**, **category tabs (top)**, and the **current order (right)**.

Adding items

• Tap a **category tab** (e.g. Popular, Mains, Drinks), then tap a **product tile** to add one to the order.

• Tap the **+** on a tile to add without leaving the tab.

• **Modifiers**: products with options open a modifier dialog — choose size, extras, etc.

• **Item notes**: long-press or use the note action to attach a kitchen note to a line.

• **Barcode**: click the scan field and scan a product barcode to add it instantly.

The current-order panel

• Shows **operator, room, table, order type**, and seat buttons.

• **Seat**: assign lines to a seat when splitting by seat.

• Line controls: quantity, price, remove.

• **TOTAL** updates live.

Seats

Tap **SEAT 1/2/3…** to attribute items to a guest. Useful for split-by-seat payment later.

---

4. Rooms, tables and floor plan

• Sidebar **Rooms** shows all rooms; each room contains tables.

• Tap a **table** to open its order. Occupied tables show the running total.

• **Table transfer**: move an open order to another table (Manager).

• **Split bill**: divide one table's order across seats, items, or custom amounts.

• **Hold / Fire** (Course management): send items to the kitchen now or hold them for a later course.

• **Floor plan editor** (Manager): drag tables, rename, resize, set capacity. The layout is stored per room.

---

5. Payments

Taking payment

Tap **Take payment**.

Choose a **payment method** (Cash, Card, …). Methods are configurable under Settings → Payment.

Cash: enter tendered amount — the screen shows **TENDERED** and **CHANGE**. Quick-tender buttons (exact, 20, 50…) speed this up.

Card: confirm on the terminal, then accept. Virtual terminal mode can email an invoice link.

The sale is recorded and the **receipt prints** to the routed printer.

Split payments

A ticket can be paid with **multiple methods** (e.g. part cash, part card). Each method prints its own receipt line and appears in the tender breakdown.

Cash rounding

When enabled, totals round to the nearest 0.05 (configurable). The receipt shows a **ROUNDING** line.

Special payment types

• **Tabs / Charge tabs**: open a customer tab, charge items over time, settle later (credit limits apply).

• **Deposits & special orders**: take a deposit now, collect goods later.

• **Offline card queue**: if the network is down, card sales queue and settle when back online.

• **Refunds**: Manager → select a past receipt → choose items → refund to original method. Stock is restocked automatically; a refund ticket prints to the Refund destination.

---

6. Order management

• **Park / Recall**: park an order to clear the screen; recall it from the parked list.

• **Repeat order**: duplicate the last ticket (takeaway regulars).

• **Order type**: Dine-in, Takeaway, Delivery, Kiosk — shown on the ticket and in reports.

• **Split bill**: by seat, by item, or custom amount.

• **Table transfer**: move orders between tables.

• **Course / Hold-Fire**: fire starters now, hold mains for a timed course.

• **Combo deals**: bundled products at a set price.

• **86 an item**: mark a product out of stock — it greys out on the menu and shows on the 86 board.

---

7. Discounts, tips and fees

• **Discounts**: percentage or fixed amount, per line or per ticket. Employee discount applies automatically for staff (percentage set in Settings → Staff).

• **Voids / Comps**: void a line before payment; comps mark items as free (both audited).

• **Service charge**: automatic % on dine-in (toggle).

• **Cash discount / Card surcharge**: adjust price by payment method.

• **Tips**: add a tip at payment; tips appear on the shift report and payroll export.

• **Happy hour**: scheduled automatic discounts by time/day — configure under Settings → Customers.

---

8. Customers, loyalty and gift cards

• **Customer database**: name, phone, email, notes. Attach a customer to a ticket for history and loyalty.

• **Loyalty**: customers earn points per purchase; redeem as discounts.

• **Gift cards**: sell, activate, check balance, redeem. Balances live in the shared database.

• **e-Gift email**: send a gift card by email at sale time.

---

9. Stock and purchasing

• **Stock levels**: each product has a stock quantity; sales decrement it.

• **Reorder point + low-stock banner**: the home screen warns when items fall below reorder level.

• **Stocktake**: count physical stock; the system computes variance with an audit trail.

• **Waste & expiry**: log waste (spoilage, breakage); reports show waste cost.

• **Transfers**: move stock between locations (multi-branch).

• **Suppliers**: manage vendor list; **Purchase Orders** — create, receive, cancel, email as PDF. Receiving adds stock.

• **Food cost**: product cost fields drive margin reports.

• **Barcode labels (Code 39)**: print shelf labels from the product catalog.

• **Weight-priced items**: scale entry prompt for kg items.

• **Product variants**: size/color variants with CSV import.

---

10. Staff: clock, shifts and payroll

• **Clock in/out**: at login (optional) or from the Operator screen.

• **Shift report**: hours worked, sales per operator, tips, discounts given.

• **Payroll export (CSV)**: hours × gross-pay rate, ready for accounting.

• **Employee discount**: set a per-operator discount %.

• **Scheduling** (when enabled): rota view for the week.

---

11. Kitchen display and 86 board

• **Kitchen Display (KDS)**: live ticket queue on a second screen. Shows elapsed time, late alarm (configurable minutes), and tap-to-bump.

• **86 board**: dedicated screen of out-of-stock items, auto-populated when stock hits zero or staff 86 an item.

---

12. Reports

Open **Settings** → **Reports** (Manager). Key reports:

Report	What it shows
Sales (X / Z)	Totals for the day / period
Payment breakdown	Cash, card, voucher, tip totals
By operator / product / family	Performance breakdowns
Discount & void report	Who discounted/voided what, and why
Occupancy heatmap	Covers by hour and daypart
Menu engineering	Stars, plowhorses, puzzles, dogs (qty × margin)
Accounting export	CSV journal (QuickBooks / Xero compatible)
Server performance	Terminals ranked by uptime/sales
AI insights	Plain-language summary of the day's patterns
Live dashboard	Real-time KPIs while trading

All CSV exports use **invariant-culture decimals** (safe for any spreadsheet locale).

---

13. End of day (X / Z)

Settings → End day (X / Z).

X report: mid-day snapshot (does not close the day).

Z report: closes the day. Shows:

- SUMMARY (gross, discounts, tips, net)

- PAYMENT BREAKDOWN (per method)

- BY OPERATOR / PRODUCT / FAMILY

Cash-up: count the drawer, system shows expected vs counted, records variance.

Cloud backup: if configured, the Z report auto-uploads a full-database backup to the head office.

Print or export the report.

---

14. Settings

Settings is organised into categories (left column):

Category	Contains
Management	Operators, products, families
Reports	All reports and exports
Network	Cloud sync, API, webhooks, store ID
Ordering Table	Room management, floor plan, table features
Payment Pricing	Methods, rounding, fees, tabs, deposits
Staff	Clock, shifts, payroll, discounts, training mode
Inventory Stock	Stock, purchasing, suppliers, variants, labels

Customers	Database, loyalty, gift cards, happy hour
Operations	Branches, refunds, QR, kiosk, customer display
Receipts Display	Email/SMS, receipt search, multi-language

• Use the **toggles** to switch features on/off — disabled features disappear from the UI.

• **Language switcher** (when Multi-language is on): English / Français / العربية — the app restarts to apply.

• **Done** returns to the order screen.

---

15. Multi-language and Arabic RTL

• Three languages ship built-in: **English**, **Français**, **العربية**.

• Switch in **Settings** → **Language**; the app saves and restarts.

• Currency symbol and date format follow the language (en-GB / fr-FR / ar-MA).

• **Arabic mode flips the entire layout (RTL)**: sidebar on the right, order panel on the left, menus mirrored.

• **What is never translated**: product names, family names, room/table names, payment-method labels, printer names — these are your business data.

• Receipts print in the currently selected language.

---

16. Network, cloud and API

Multi-terminal

• One **Main PC** holds the database; **Order PCs** connect via the UNC path.

• Status light at bottom-left: `MAIN PC` / `ORDER PC` + print-server status.

Cloud sync

• **Settings → Network**: set head-office URL, shared key, sync interval.

• **Push-only by default**: each store pushes completed sales; the head office does not overwrite local data.

• **Pull sales history**: fetch your own sales from head office (scope = mine).

• **Full-database backup vault**: End Day Z report auto-uploads a zip; manual *Upload backup now* available; 14-zip rotation at head office.

• **Restore from home**: download the latest backup zip, extract, restart.

REST API

• Enable in Settings → Network; set an **API key**.

• Routes: `GET/POST /sync/sales`, `POST/GET /sync/backup`, health endpoint.

• **Sale webhooks**: POST a JSON payload to your URL on every completed sale.

---

17. Guest ordering, QR and kiosk

• **Guest URL**: a public link (e.g. `https://your/order`) shows the menu on the customer's phone.

• **QR codes**: print QR table labels — each table's QR opens the menu pre-attributed to that table.

• **Call waiter / order status**: guests can call staff or check order status from the QR page.

• **Kiosk mode**: fullscreen self-order, pay at counter — launch from Settings → Operations.

• **Customer display**: second screen facing the guest shows the running total and thank-you message.

• Guest orders appear on the main screen with a source badge and can be managed like any order.

---

18. Troubleshooting

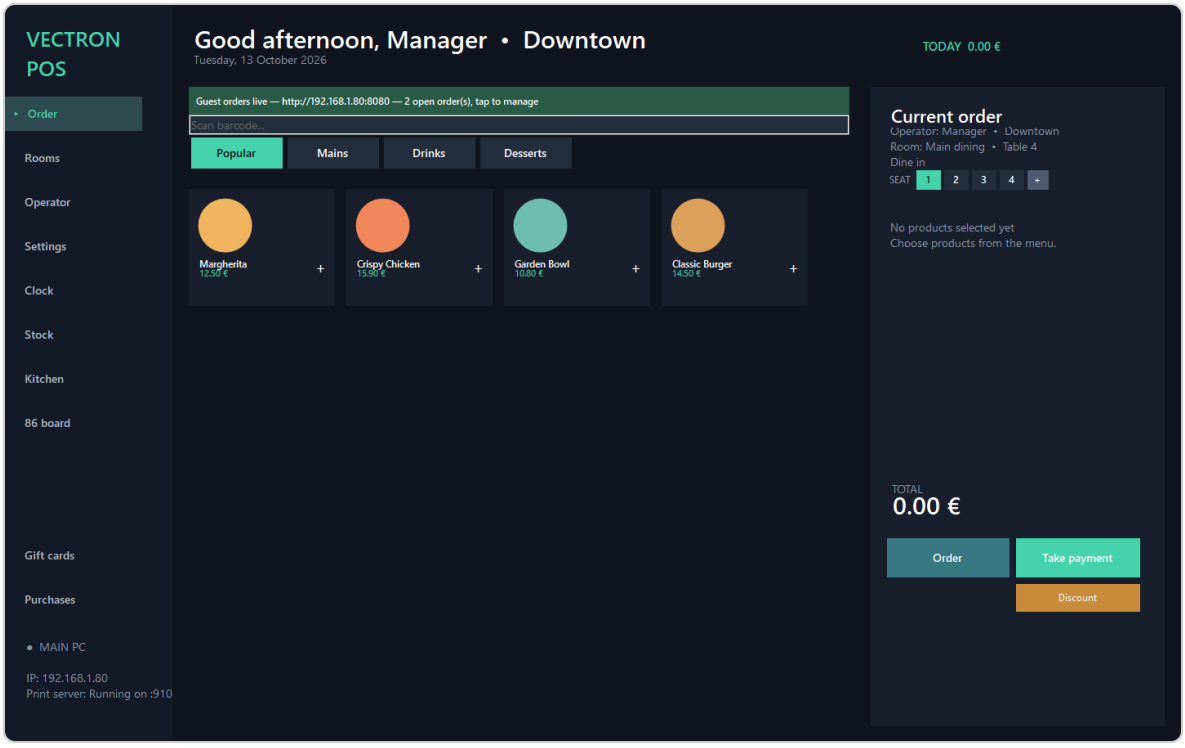

Symptom	Fix
Login rejected	Confirm the correct operator is selected; PINs are per-operator. Reset via Manager → Manage operators.
Printer not printing	Settings → Printer routing: check the destination points to the right Windows printer; print a test page. Print server must be running on the Main PC (status shown bottom-left).
Order PC can't see data	Verify the UNC path (`\\MAIN-PC\client database`) is reachable; firewall must allow SMB.
Language doesn't change	The switcher restarts the app — allow a few seconds. If it reverts, check Multi-language toggle is on.
Cloud sync failing	Settings → Network: check URL, key, and that the head-office server is reachable. Sync errors appear in the status line.
Sale missing from report	Check training mode is off (training sales are not recorded). Check the date filter on the report.
Cash drawer not opening	Drawer is triggered by the payment printer — confirm the printer supports drawer kick and the cable is connected.
App feels slow	Settings → Staff → Server performance shows per-terminal health; check disk space on the Main PC.

Part 2 — Complete Setup Guide (Step by Step)

For restaurant managers: configure the app from zero to fully operational in 10 steps.

> **How to open Settings:** from the main order screen, tap **Settings** in the left sidebar.

> **Colour code on toggles:** 🟢 **Green = ON** · 🔴 **Red = OFF** · ⬛ **Dark grey = action button** (opens a dialog or runs a command).

Step 1 — Multi-screen setup (Main PC + Order PCs)

Do this first if you have more than one terminal.

Your restaurant has one **Main PC** (hosts the database) and any number of **Order PCs** (take orders, send to kitchen).

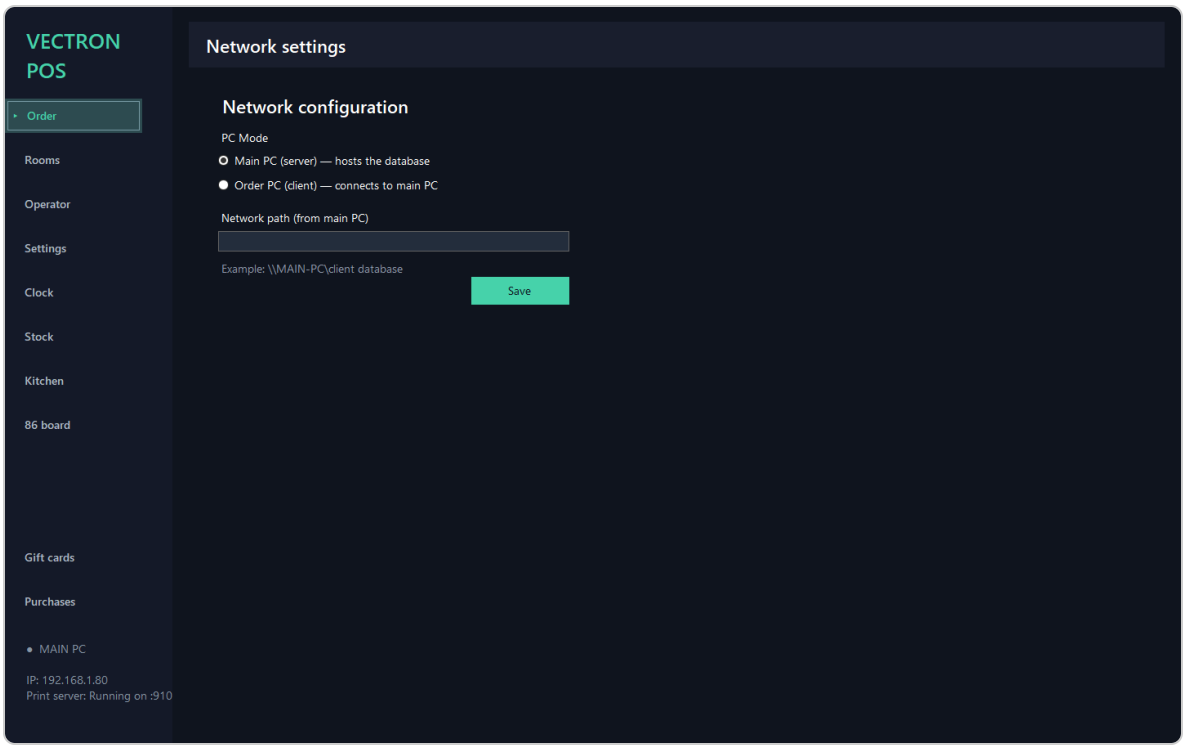

On the Main PC

Open **Settings** → **Network settings**.

Select **Main PC (server) — hosts the database**.

Press **Save**.

Note the computer name shown at the bottom-left of the screen (e.g. `MAIN PC`) and its IP address.

On each Order PC

Install and launch Vectron POS on the second PC.

At the network screen (or **Settings** → **Network settings**), select **Order PC (client) — connects to main PC**.

In **Network path**, type the Main PC's shared folder, for example:

`

\\MAIN-PC\client database

`

Replace `MAIN-PC` with your Main PC's actual computer name.

Press **Save**. The app restarts and connects to the Main PC.

Before you start

• Both PCs must be on the **same network** (same router / Wi-Fi).

• Windows file sharing (SMB) must be enabled on the Main PC.

• The status at bottom-left of the Main PC shows `MAIN PC`; Order PCs show `ORDER PC`.

Step 2 — Create your operators (staff logins)

Every person who uses the till gets their own **operator** with a PIN and a role.

Open **Settings** → **Management** → **Manage operators**.

You will see the default operators (Manager, Cashier). Click **New operator**.

Fill in:

- **Operator name** — e.g. `Sara`, `Ahmed`, `Waiter 1`

- **Password (PIN)** — a 4-digit PIN (e.g. `1111`). Leave empty for no PIN.

- **Hourly wage** — used for labour-cost reports and payroll export (optional).

Tick the **Permissions** this person should have:

| Permission | Meaning |

|---|---|

| **Take payments** | Can process sales and take money |

| **Discounts** | Can apply discounts / comps |

| **Refunds** | Can refund past sales |

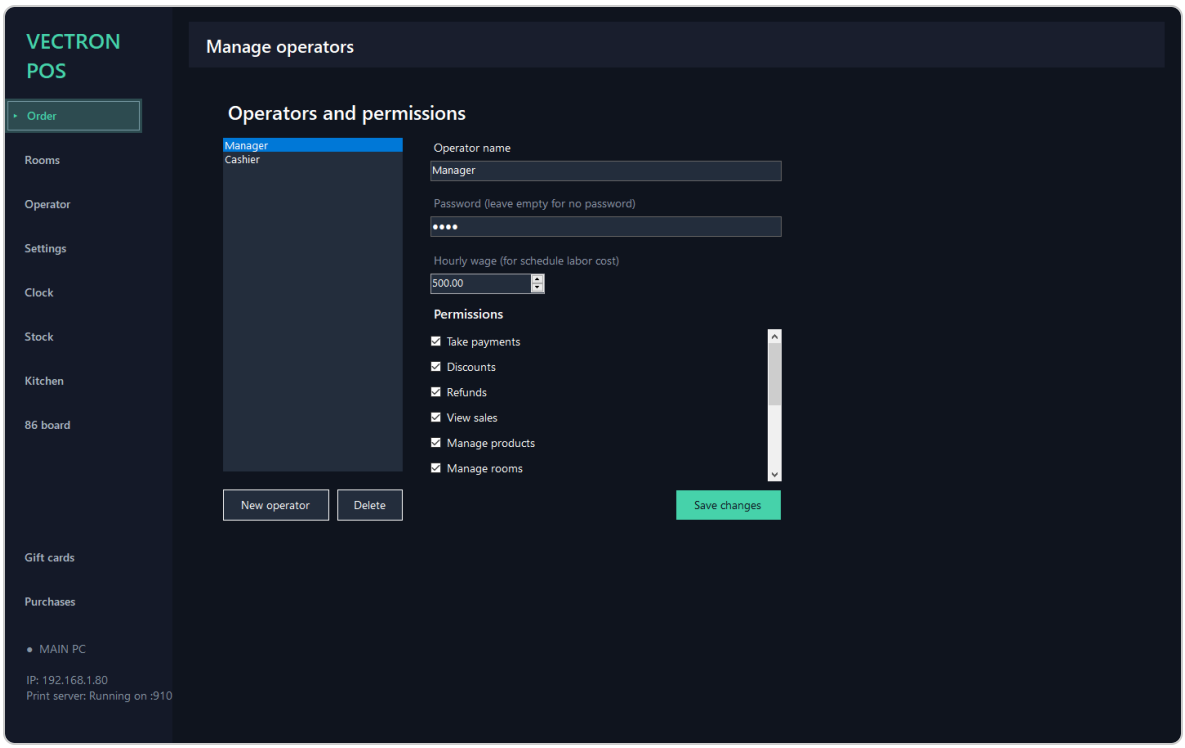

| **View sales** | Can open sales reports |

| **Manage products** | Can edit the product catalog |

| **Manage rooms** | Can edit rooms / tables / floor plan |

Press **Save changes**.

Repeat for each staff member.

Recommended setup

Role	Permissions
Manager	All boxes ticked
Cashier	Take payments ✅ · View sales ✅ · rest ❌
Waiter	Take payments ✅ · rest ❌
Kitchen	No login needed — use Kitchen Display instead

> **Tip:** give every waiter their own operator so sales and tips are tracked per person.

Step 3 — Set currency and tax (TVA)

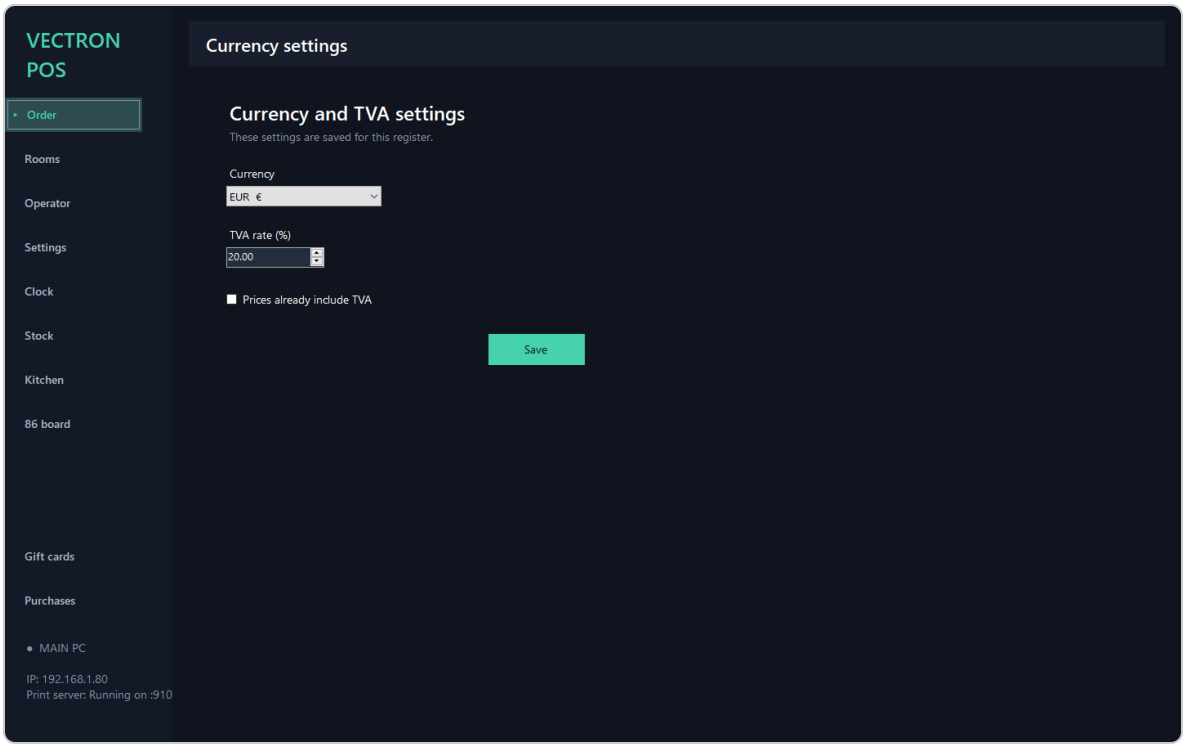

Open **Settings → Management → Currency and TVA**.

Currency — pick your currency from the list (EUR €, USD $, MAD, etc.).

TVA rate (%) — enter your standard tax rate (e.g. `20` for 20 %, `10` for Morocco's 10 %).

Prices already include TVA — tick this if the menu prices you enter are *tax-inclusive* (normal in restaurants). Leave unticked if prices are *before tax*.

Press **Save**.

> All receipts and reports will now show the correct currency and tax.

Step 4 — Create your families (menu categories)

Families are the tabs shown at the top of the order screen (Popular, Mains, Drinks…).

Open **Settings** → **Management** → **Manage families**.

You'll see default families (General, Food, Drinks, Desserts). To add your own:

- Click **New family**.

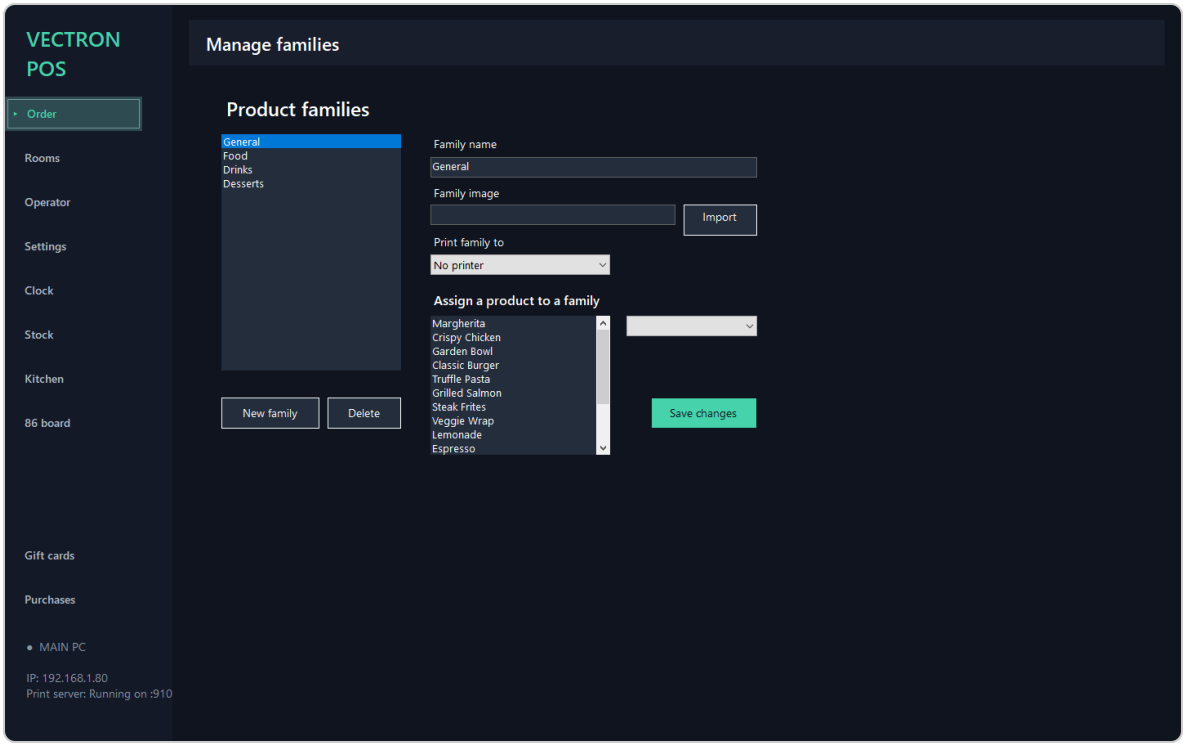

- **Family name** — e.g. `Starters`, `Pizzas`, `Hot drinks`, `Shakes`.

- **Family image** *(optional)* — click **Import** and choose a picture. The tile on the order screen will show it.

- **Print family to** — choose which printer receives this family's items (e.g. `Kitchen` for food, `Bar` for drinks). This is how kitchen tickets get routed automatically.

Press **Save changes**.

To assign existing products to this family: select a product in the list on the right, pick the family from the dropdown, press **Save changes**.

Example family layout

Family	Printed to
Starters	Kitchen
Mains	Kitchen
Desserts	Kitchen
Hot drinks	Bar
Cold drinks	Bar
Beers & wine	Bar

Step 5 — Create your products

Open **Settings** → **Management** → **Manage products**.

Click **New product**.

Fill in:

- **Name** — e.g. `Margherita`, `Chicken Caesar`, `Cappuccino`

- **Category** — pick the tab where it appears (Popular, Mains, Drinks…)

- **Price** — sale price (tax rules from Step 3 apply automatically)

- **Color** *(optional)* — tile colour on the order screen (click to pick)

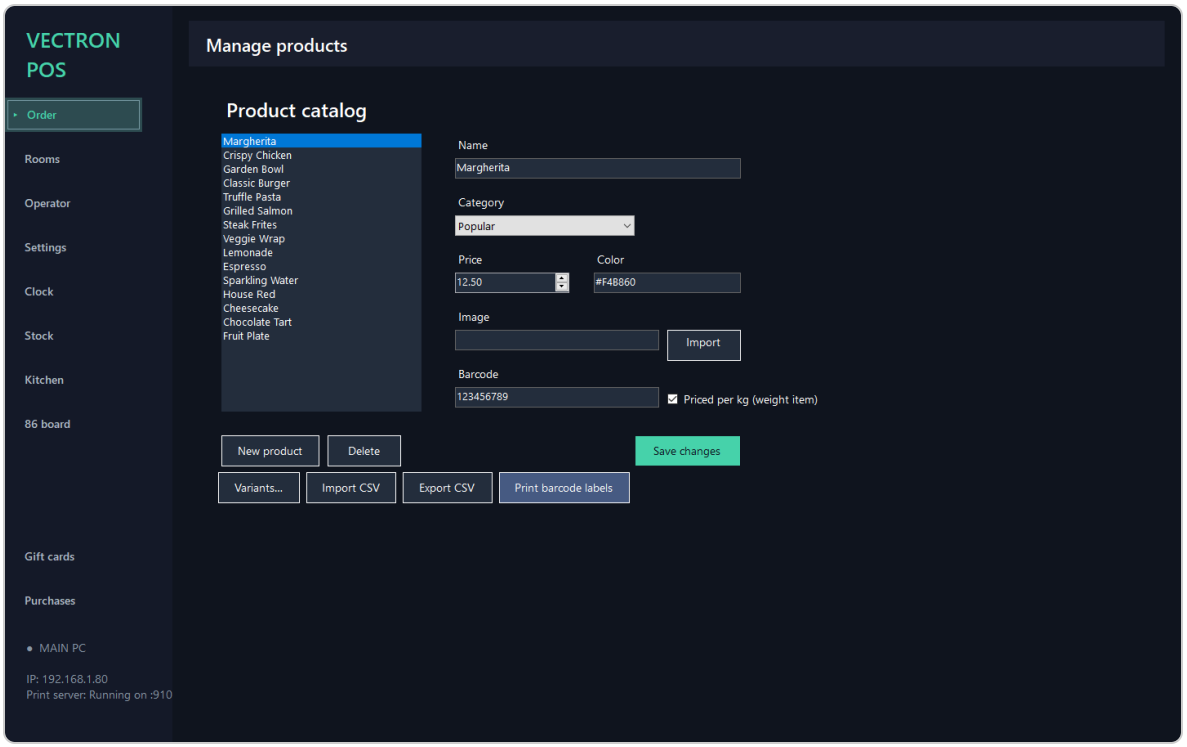

- **Image** *(optional)* — click **Import** to add a photo

- **Barcode** — scan or type the product's barcode (for barcode scanning)

- **Priced per kg** — tick only for weight-priced items (cheese, meat, candy)

Press **Save changes**.

Repeat for every product.

Shortcuts

• **Import CSV** — bulk-import products from a spreadsheet (Name, Price, Category, Barcode columns).

• **Export CSV** — back up your catalog.

• **Variants…** — add size/color variants (e.g. Small / Medium / Large).

• **Print barcode labels** — print Code-39 shelf labels for your products.

> **Tip:** create families first (Step 4), then products — each product picks its family during creation.

Step 6 — Set up rooms and tables

Open **Settings → Management → Room management**.

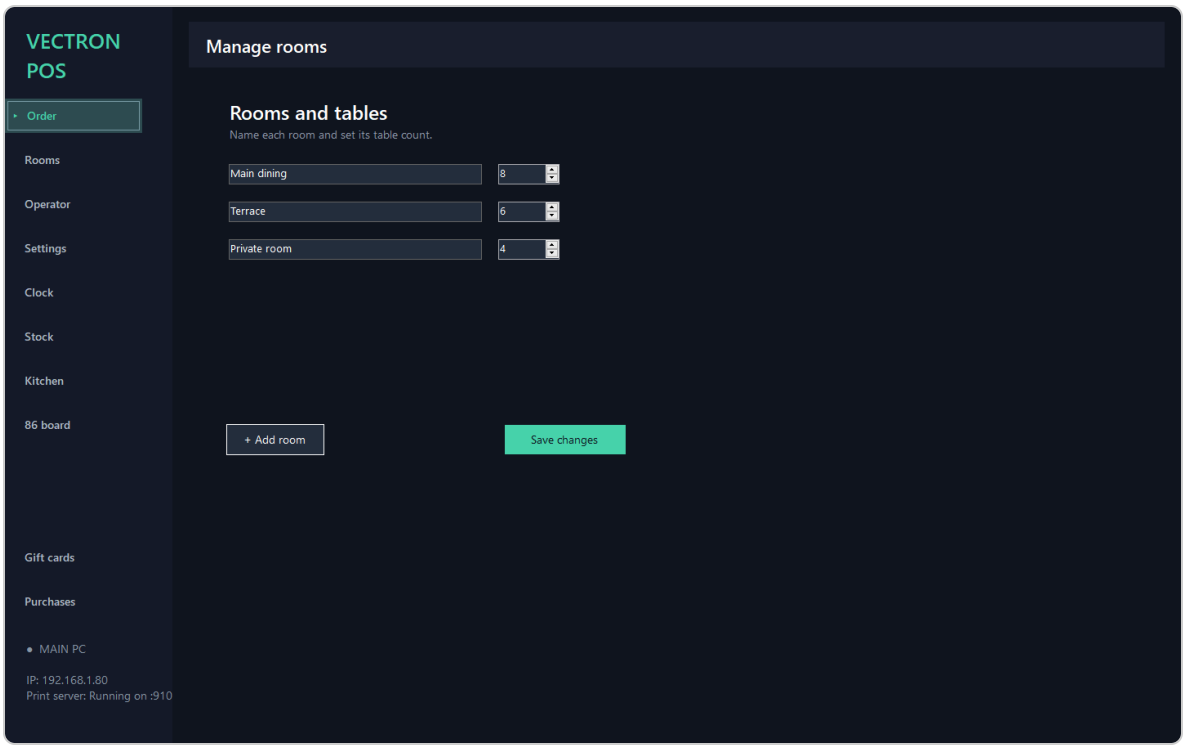

Default rooms (Main dining, Terrace, Private room) are listed. To edit:

- **Rename** a room by typing in its text box.

- **Table count** — set how many tables each room has (e.g. Main dining = 20).

Click **+ Add room** to create more (e.g. `Bar area`, `Garden`).

Press **Save changes**.

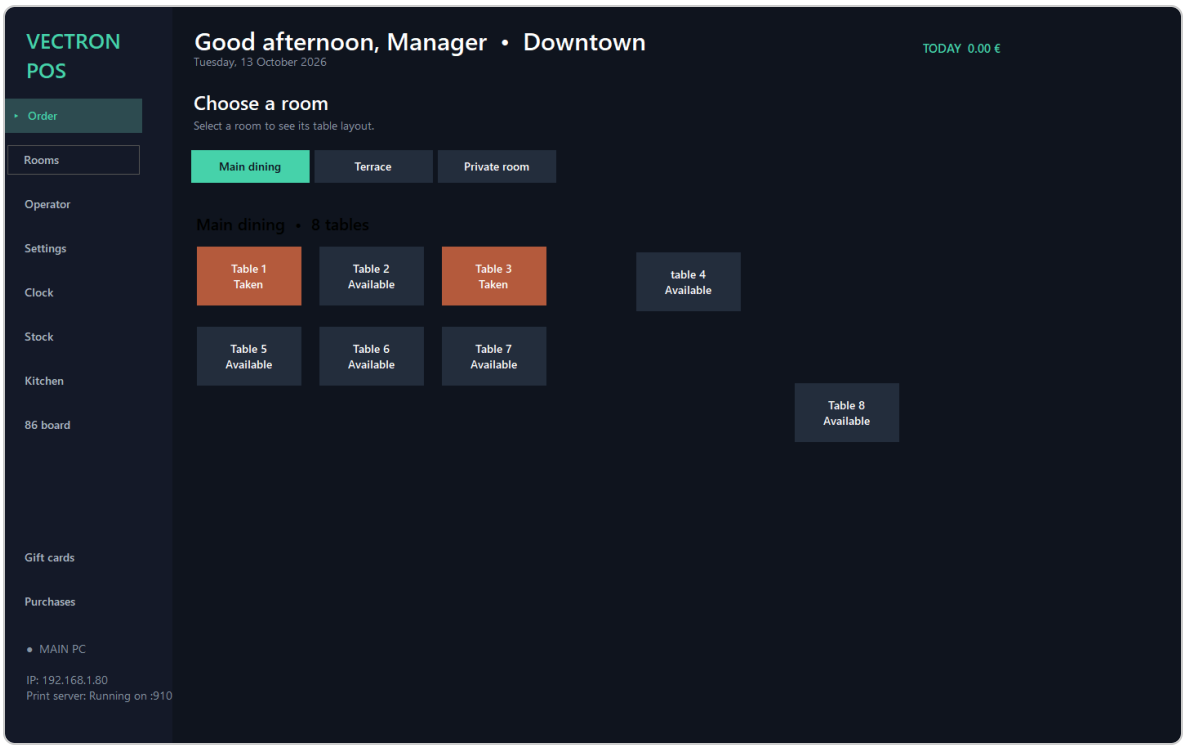

Arrange tables on the floor plan

Go to **Rooms** in the left sidebar.

Tap a **room tab** at the top.

Each table is a tile — **drag** tiles to match your real layout.

Tap a table to open its order; the tile turns 🔴 **Taken** when occupied and returns to ♦ **Available** when the bill is paid.

Step 7 — Configure printers (Printer routing)

This is the most important technical step — tickets must reach the right printer.

Open **Settings → Management → Printer routing**.

You'll see default destinations: **Bill**, **Payment**, **Kitchen**, **Refund**, **Cancel**.

For each destination:

- **Destination name** — keep or rename (e.g. `Kitchen 1`, `Bar`, `Receipt`).

- **Windows printer** — pick the physical printer installed on this PC (e.g. `EPSON TM-T20`, `VLPT2`).

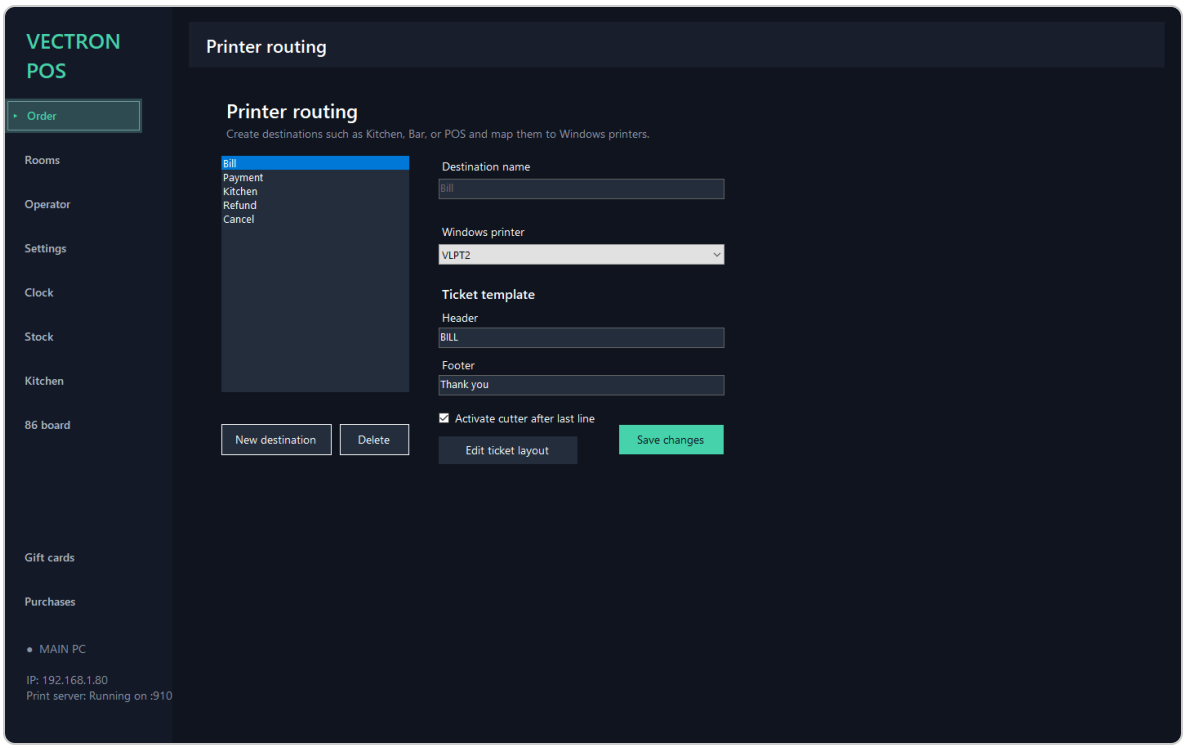

- **Ticket template → Header** — first line printed (e.g. `KITCHEN ORDER`, `RECEIPT`).

- **Ticket template → Footer** — last line (e.g. `Thank you!`).

- **Activate cutter after last line** — tick if the printer has a paper cutter.

Click **New destination** to add more (e.g. `Bar printer`, `Grill station`).

Press **Save changes**.

Typical restaurant routing

Destination	Printer	Purpose
Bill	Receipt printer (counter)	Customer bill
Payment	Receipt printer (counter)	Paid receipt
Kitchen	Kitchen printer	Food orders
Bar *(new)*	Bar printer	Drink orders
Refund	Receipt printer	Refund receipts

Test your printers

Print a Windows test page for each printer (Windows Settings → Printers).

In Vectron POS, take a test order and verify the kitchen ticket appears on the kitchen printer.

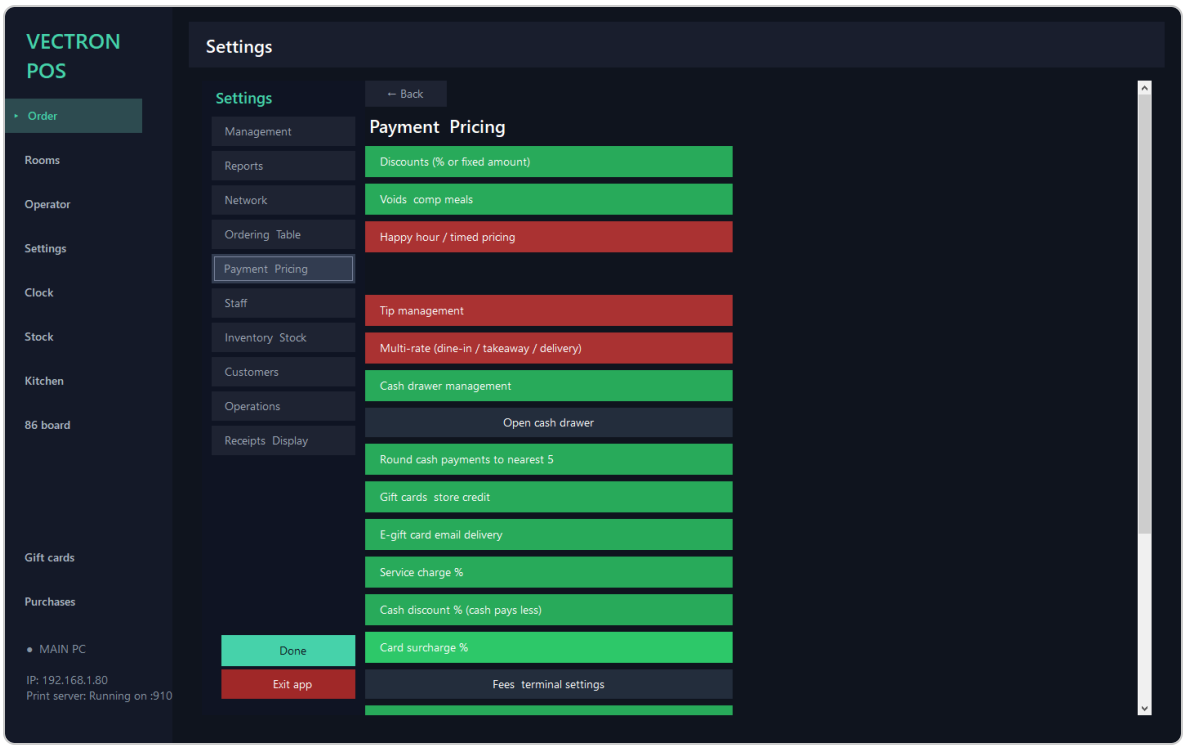

The bottom-left status should show **Print server: Running on :910**.

> **Edit ticket layout** — click this button to fine-tune what's printed (logo, room/table, seat, discount lines…).

Step 8 — Enable payment & pricing features

Open **Settings** → **Payment Pricing**. Toggle features on/off (🟢 green = ON):

Feature	What it does
Discounts (% or fixed amount)	Staff can discount lines / tickets
Voids / comp meals	Void before payment, comp items for VIPs
Happy hour / timed pricing	Automatic discounts at set times
Tip management	Add tips at payment; shown on shift report
Multi-rate (dine-in / takeaway / delivery)	Different prices per order type
Cash drawer management	Drawer kick on cash payment + no-sale log
Round cash payments to nearest 5	Round to 0.05 (handy in cash-heavy markets)
Gift cards / store credit	Sell & redeem gift cards
Service charge %	Auto-add service charge on dine-in
Cash discount %	Cash pays slightly less
Card surcharge %	Card pays slightly more
Fees / terminal settings	Per-method fee rules

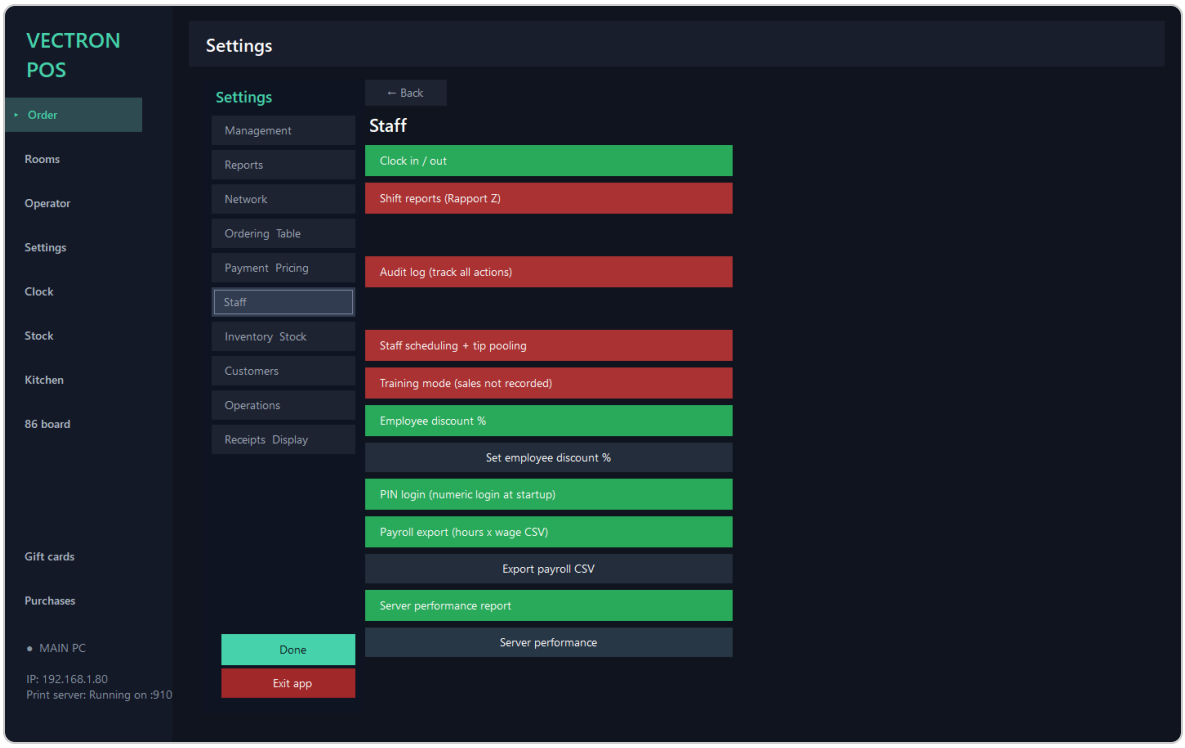

> Toggle OFF anything you don't use — it disappears from the UI and keeps the screen clean for staff.

Step 9 — Staff settings

Open **Settings** → **Staff**:

Feature	Recommended	Notes
Clock in / out	🟢 ON	Staff clock in at login, out at end of shift
Shift reports	🟢 ON	Hours + sales per operator
Audit log	🟢 ON	Tracks who voided/refunded what
Staff scheduling + tip pooling	optional	Rota + shared tips
Training mode	🔴 OFF for live	Practice without recording sales

Employee discount %	🟢 ON	Set the % (e.g. 20) — applies to staff purchases
PIN login	🟢 ON	Numeric PIN at startup
Payroll export (CSV)	🟢 ON	Hours × wage → accounting
Server performance	🟢 ON	Health dashboard

Step 10 — Optional features & final checks

Open each remaining Settings category and switch on what you need:

Ordering & Table

• Table transfer, split bill, hold/fire courses, park/recall orders, seat ordering.

Inventory & Stock

• Stock tracking, low-stock alerts, stocktakes, waste tracking, purchase orders, suppliers, barcode labels.

Customers

• Customer database, loyalty points, gift cards, happy hour.

Operations

• Delivery orders, multi-branch, refunds, QR self-ordering, kiosk mode, customer display.

Receipts & Display

• Email/SMS receipts, receipt search & reprint, multi-language (EN / FR / AR).

Final checklist before opening

☐ Operators created with correct PINs and permissions

☐ Currency and TVA set correctly

☐ Families created and assigned to printers (Kitchen / Bar)

☐ All products entered with correct prices

☐ Rooms and tables configured; floor plan arranged

☐ Printers tested (bill + kitchen at minimum)

☐ Payment toggles match how you trade (cash discount? service charge?)

☐ Clock-in enabled; training mode OFF

☐ Multi-terminal tested (Order PC sees Main PC's data)

☐ End-of-day: run a **Z report** to verify totals
